

SIDDHARTHA SINHA - WRITTEN EXAM

A) MCQ - 1 marks

Ans 1. Both A and B

Ans 2. \$_POST

Ans 3. mysqli_connect()

Ans 4. If statement

Ans 5. php artisan make:controller ControllerName

Ans 6. ORM

Ans 7. Templating Engine

Ans 8. SELECT

Ans 9. WHERE

Ans 10. Primary Key

B) Session and cookies are both used to manage state of a machine, which is used to remember which user is trying to perform any actions across the browser. Since https stateless, where it treats every request is new, it is need to keep track and tell that the sequence of request belongs to the same client. To do that Session (server side) and cookies(client side) are used,

C) Indexing is basically a data structure that is used to speed up the lookup speed when tables/relations are queried. It is need so that for similar or same data that are request on frequent basis are more readily available and the db is not searched from start to end.

D) DELETE - delete is used to delete or remove a particular row from a table based on certain conditions.

TRUNCATE - truncate is used to delete all the rows present in a relation/table but keeping the table schema intact.

DROP - drop is deleting the entire db with table, data and schema. It's a complete wipeout

E) MVC stands for MODEL - VIEW - CONTROLLER where each of them handles a specific part of request. The 'View' is the front facing design with which the user intracts with like the forms, button and others. It handles how data is displayed to the client. A 'Controller' is the one who takes the request from

the client side request and forwards them to the logical operation. It asks the model for the required data and then sends them to the client view side. The 'Model' is the database layer, which handles the fundamental business rules like querying the db to get the request data or to insert/remove a specific data.

F) MIGRATIONS in laravel is generated using php artisan `make:migration migration_name`, which is used to create the schema of the tables in the database. They also act as version controllers for our database, keeping records of modifications that are done throughout the project.
